Consistency-Based
Diagnosis

The Limitations of
Logic

- We want to tell our computers facts that are true of the world.
“It is raining.”
- Some of these facts specify how one thing is related to another.
“It is raining implies it is wet.”
- We want our computers to be able to infer what else must be true of the world.
“It is wet.”
- A *logic* is a system for inference from facts.

Formal Semantics 2

Examples

Proof Procedures

Consistency-Based
Diagnosis

The Limitations of
Logic

- A *proposition* is something that is true or false.
- An *atomic proposition* or *atom* consists of a single *symbol*. (\approx boolean variable)
- A *compound proposition* is constructed from simpler propositions p and q using *logical operators* (\approx boolean expression):
 - $\neg p$ (read “not p ”)–*negation*
 - $p \wedge q$ (read “ p and q ”)–*conjunction*
 - $p \vee q$ (read “ p or q ”)–*disjunction*
 - $p \rightarrow q$ (read “ p implies q ”)–*implication*
 - $q \leftarrow p$ (read “ q if p ”)–*implication*
 - $p \leftrightarrow q$ (read “ p iff q ”)–*equivalence*

[Note: I prefer using \rightarrow to \leftarrow .]

Consistency-Based Diagnosis

The Limitations of Logic

Semantics maps between symbols and the world.

- Begin with a task domain.
- Choose symbols in the computer to denote propositions.
Symbol \approx variable name
- Tell the system knowledge about the domain.
Knowledge \approx code and inputs
- Ask the system true/false questions.
Ask questions \approx run a function
- The system should answer true, false or unknown as appropriate.
- You can interpret the answer because you know the meaning of the symbols.

Informal Semantics

▷ Informal
Example

Formal Semantics 1

Formal Semantics 2

Examples

Proof Procedures

Consistency-Based
Diagnosis

The Limitations of
Logic

- In computer:
 $sw_up \wedge power \wedge unlit_l1 \rightarrow l1_broken$
- In user's mind: $sw_up =$ switch is up,
 $power =$ there is power in,
 $unlit_l1 =$ light #1 isn't lit,
 $l1_broken =$ light #1 is broken
- The computer doesn't know the meaning of the symbols.
- The user can interpret the symbols using their meaning.

Formal
▷ Semantics 1

Formal Semantics 2

Examples

Proof Procedures

Consistency-Based
Diagnosis

The Limitations of
Logic

- An *interpretation* I maps atoms to true or false.
- Based on how logical operators work, an interpretation maps each proposition to a truth value.
- Propositions may have different truth values in different interpretations.

p	q	$\neg p$	$p \wedge q$	$p \vee q$	$p \rightarrow q$	$q \leftarrow p$	$p \leftrightarrow q$
true	true	false	true	true	true	true	true
true	false	false	false	true	false	false	false
false	true	true	false	true	true	true	false
false	false	true	false	false	true	true	true

Consistency-Based
Diagnosis

The Limitations of
Logic

- A *knowledge base* is a set of propositions that the agent is given as being true.
- A *model* of knowledge base is an interpretation in which all the propositions in the knowledge base are true.
- If KB is a knowledge base and p is a proposition, KB *entails* p (written $KB \models p$) if p is true in every model of KB .
- $KB \models p$ means that no interpretation exists in which KB is true and p is false.
- If $KB \models p$ we also say p logically follows from KB , or p is a logical consequence of KB .

Consistency-Based
Diagnosis

The Limitations of
Logic

- A *proof* is a derivation that a proposition logically follows from a knowledge base.
- Given a proof procedure, $KB \vdash p$ means p can be *derived* or *proved* from KB .
- Recall $KB \models p$ means KB entails p , that p is true in all models of KB .
- A proof procedure is *sound* if $KB \vdash p$ only if $KB \models p$. Anything that is proved is also entailed.
- A proof procedure is *complete* if $KB \models p$ then also $KB \vdash p$. Everything that is entailed can be proved.

Example

Consistency-Based
Diagnosis

The Limitations of
Logic

- Enumerate all interpretations.
- Determine which interpretations are models of the KB.
- Determine which atoms (and any other propositions of interest) are true in all models (or false in all models).
- This is $\Omega(2^n)$ where n is the number of atoms.

Proofs

Brute Force

▷ CSP Inference

Definite Clauses

Example

Contradiction

Inference Rules

Resolution

Example

Consistency-Based
Diagnosis

The Limitations of
Logic

- Set up KB as a CSP. Each atom is a variable with two possible values. Each proposition in the KB is a constraint.
- Solutions of CSP = models of KB.
- Run arc consistency/domain splitting.
- Don't stop after finding one CSP solution (KB model). Find them all.
- Determine which atoms are true in all models (or false in all models).
- This is still potentially exponential, but more efficient than brute force.
- See Section 4.6.1.

CSP Inference

▷ Definite Clauses

Example

Contradiction

Inference Rules

Resolution

Example

Consistency-Based
Diagnosis

The Limitations of
Logic

- Suppose all propositions in KB are *definite clauses*, either:
 - an atom (e.g., an observation), or
 - of the form $p \rightarrow q$, where p and q are atoms (e.g., a rule about the behavior of the world)
 - of the form $p_1 \wedge \dots \wedge p_k \rightarrow q$, where q and each p_i are atoms
- Running CSP inference is efficient (linear in the length of the KB).
- See Section 5.2.

Example

▷ Contradiction

Inference Rules

Resolution

Example

Consistency-Based
Diagnosis

The Limitations of
Logic

- Suppose we want to determine if $KB \models p$.
- Let $KB' = KB \cup \{\neg p\}$
- Determine that no model exists for KB' .
- Conclude that $KB \models p$.
- Should probably show that KB has at least one model.

Propositional Logic

Examples

Proof Procedures

Proofs

Brute Force

CSP Inference

Definite Clauses

Example

Contradiction

▷ Inference Rules

Resolution

Example

Consistency-Based
Diagnosis

The Limitations of
Logic

- *Modus ponens* is an inference rule. If p is true, and if $p \rightarrow q$ is true, then q is true.
- That is, if $KB \models p$ and $KB \models p \rightarrow q$, then $KB \models q$.
- *Resolution inference rule* (really, two rules)
 - If $KB \models p \vee q$ and $KB \models \neg p$, then $KB \models q$.
 - If $KB \models p \vee q$ and $KB \models \neg p \vee r$, then $KB \models q \vee r$.
- Remember p and q and r can be any propositions, not just atoms.

Logic

Propositional Logic

Examples

Proof Procedures

Proofs

Brute Force

CSP Inference

Definite Clauses

Example

Contradiction

Inference Rules

▷ Resolution

Example

Consistency-Based
Diagnosis

The Limitations of
Logic

- *Resolution theorem proving* is a sound and complete inference procedure for propositional logic.
- Transform the KB to *conjunctive normal form*, meaning each proposition in the KB is of the form l or $l_1 \vee \dots \vee l_k$, where each l_i is a *literal*, an atom or the negation of an atom.
- To show $KB \models p$, let $KB' = KB \cup \{\neg p\}$, and ensure KB' is in CNF.
- Proof is by deriving a contradiction, derive both a and $\neg a$ for some atom a .
- Worst-case exponential-time. Lots of approaches to reduce the exponential.

Diagnosis Examples

The Limitations of
Logic

- Assume components are working normally.
- Need a set of *assumables* A , e.g.,
 $A = \{ok_l1, ok_l2, ok_s1, \dots\}$
- Show that $KB \cup A$ leads to a contradiction, which implies A is false, that something's wrong. In this case, A is called a *conflict*.
- Want to isolate the problem, e.g., is there a single fault that is consistent with KB ?
- C is a *minimal conflict* if $C \subseteq A$, C is a conflict, and no proper subset of C is a conflict.
