</tr>
</tbody>
</table>

NAME:____________________________________

**Instructions**
1. Do all of the 4 problems
3. You have 50 minutes for the exam
4. Show all your work
5. Do not separate midterm papers

1. (30 pts) Complete the following program to find if there are two numbers in the array whose product is 10. For example, the array \{1,2,3,4,5,6\} has 2 and 5 at index positions 1 and 4 respectively with product 10. If there are multiple pairs with product 10, just print one of them.

**Solution**

```c
#include <stdio.h>
#include <math.h>

int main()
{
    int i,j;
    double num[6];
    double product = 10;
    int found = 0, first, second;

    printf("Enter 6 doubles\n");
    for (i=0; i<6; i++)
        scanf("%lf", &num[i]);

    for (i=0; i<6; i++)
        for (j=i+1; j<6; j++)
            if (num[i]*num[j] == product)
            {
                found = 1;
                first = i;
                second = j;
            }

    if (found == 1)
        printf("num[%d] and num[%d] has desired product", first, second);
    else
        printf("none of the pairs have desired product\n");
    return(0);
}
```
2. (20 pts) Trace the execution of the following program. What will be the final values of array \(a\) printed?

```c
#include <stdio.h>
#include <stdlib.h>

int main()
{
    int a[5]={1,2,3,4,5};
    int i,j,temp;

    for (j=1; j<5; j++)
        for (i=0; i<5-j; i=i+2)
            {
            printf("%d %d\n",i,i+j);
            temp = a[i];
            a[i] = a[i+j];
            a[i+j] = temp;
        }

    for (i=0; i<5; i++)
        printf("a[%d] = %d\n",i,a[i]);
}

Solution:

0 1
2 3
0 2
2 4
0 3
0 4

a[0] = 2
a[1] = 1
a[2] = 5
a[3] = 4
a[4] = 3
3. (20 pts) What is the output of the following program? Show all your work for partial credit.

```c
#include <stdio.h>
int function1(int a, int b)
{
    return(a+2*b);
}
int function2(int a)
{
    return(2*a+1);
}
int main()
{
    int i=2;
    int x;

    while (i<10)
    {
        if (i>5)
            x = function1(i+1,i+1);
        else
            x = function2(i+1)-i;
        printf("%d\n",x);
        i = i + 1;
    }

    return(0);
}
```

Solution

```
5
6
7
8
21
24
27
30
```
4. (30 pts) Write a complete program to compute the following expression. Read the value of \( n \) from the user and write a single loop to evaluate the expression. Pay attention to the lower and upper bounds of summations.

\[
\sum_{i=5}^{n} 2^i - \sum_{i=1}^{n+5} 3^i
\]

Solution:

```c
#include <stdio.h>
#include <math.h>

int main()
{
    int n,i;
    float sum2 = 0;
    float pow2=2;
    float pow3=3;

    printf("Enter n\n");
    scanf("%d",&n);

    for (i=1; i<=n+5; i=i+1)
    {
        if (i>=5 && i<=n)
        {
            sum2 = sum2 + pow2;
            sum2 = sum2 - pow3;
            pow2 = pow2*2;
            pow3 = pow3*3;
        }

    printf("Sum2 = %f\n",sum2);

    return(0);
}```
