NAME:__________________________________________

Instructions
1. Do all of the 5 problems
3. You have 70 minutes for the exam
4. Show all your work
5. Do not separate midterm papers

1. (20 pts) Complete the following program to find the closest number to average in the array. For example, the array \{2, 4, 6, 3, 9, 10\} has average of 5.666667 and closest number to average in the array is 6. Note that closest number can be larger than or smaller than the average.

```c
#include <stdio.h>
#include <math.h>

int main()
{
    int i;
    double num[6];
    double average;
    double sum=0;
    double closest;

    printf("Enter 6 doubles\n");
    for (i=0; i<6; i++)
        scanf("%lf",&num[i]);

    printf("Closest is %lf\n",closest);
    return(0);
}
```

2. (20 pts) Trace the execution of the following program? What will be the final values of array a printed?

```c
#include <stdio.h>
#include <stdlib.h>

int main()
{
    int a[7]={2,0,0,0,0,0,0};
    int i=1;

    for (i=1; i<7; i++)
    {
        if (i<3)
            a[i] = a[i-1]+i+1;
        else if (i<5)
            a[i] = a[i-2]+1;
        else
            a[i] = a[i-2]*i-2;
    }

    for (i=0; i<7; i++)
        printf("a[%d] = %d\n",i,a[i]);
}
```
3. (20 pts) Write a function *Powerof* to test if a parameter *n* is a power of another parameter *k* (*n = k^m* for some integer *m*). If *n* is a power of *k*, then the function returns 1. Otherwise it returns 0. Function prototype and sample output of the function and description of the output is given below

*Powerof*(3,5) returns 0 since 3^1 = 3 < 5 < 3^2 = 9
*Powerof*(3,9) returns 1 since 9 = 3^2
*Powerof*(2,30) returns 0 since 2^4 = 16 < 30 < 2^5 = 32
*Powerof*(2,16) returns 1 since 16 = 2^4

```
int Powerof(int k, int n)
{
}
```
4. (20 pts) What is the output of the following program? Show all your work for partial credit.

```c
#include <stdio.h>

int mystery(int a, int b)
{
    return(a*b+1);
}
int mystery2(int a, int b)
{
    return(a*(b+1));
}

int main()
{
    int j,k;

    for (j=0; j<8; j++)
    {
        if (j<3)
            k = mystery(j+1,j);
        else if (j<6)
            k = mystery2(j+1,j);
        else
            k = mystery(mystery2(j,j),1);
        printf("j=%d k=%d\n",j,k);
    }

    return(0);
}
```
5. (20 pts) Write a complete program to compute the smallest value of $k$ for which the following sum is larger than $n$. Read the value of $n$ from the user and write a loop to compute the sum. Note that $n$ can be a floating point number.

$$
\frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \ldots + \frac{1}{k} > n
$$

For example for $n = 2.0$, your program should find $k$ to be 4 since

$$
\frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} = 2.08 > 2
$$

For $n = 1.6$, your program should find $k$ to be 3 since $\frac{1}{1} + \frac{1}{2} + \frac{1}{3} = 1.83 > 1.6$
