CS 1713
Introduction to Computer Programming II
Exercise 3

1. Write a program fragment to find the second largest number in an array. You can assume that you have an array data that contains 10 integers and all the integers are distinct.

2. Write a sequence of statements to swap two integers $x$ and $y$ without using a temporary variable. Note that your solution may not work for every integer (may not work for large integers).
