

Discrete Mathematical Structures CS 3233 Lecture Four

Prof. William Winsborough
September 5, 2006

Business

- Turn in Homework One
- Read Section 1.5 by Thursday
- **Homework Two:** due Tuesday September 12
 - Section 1.3: 10d, 10e, 14, 24c, 24d, 32a, 32b, 44
 - Section 1.4: 2a, 2c, 4, 10, 24, 46
 - Section 1.5: 4, 8
- Questions???

5 September 2006

Winsborough CS 3233 Lecture 4

2

Translating English into Logic

- Every student in this class has taken calculus
 - $c(x)$ means x is in the class
 - $t(x)$ means x has taken calculus
- Some students in this class do not like logic
 - $k(x)$ means x likes logic
- Not all students in this class like logic

5 September 2006

Winsborough CS 3233 Lecture 4

3

Negations of Quantified Formulas

- De Morgan's Laws for Quantifiers
 - $\neg \exists x.p(x) \equiv \forall x.\neg p(x)$
 - $\neg \forall x.p(x) \equiv \exists x.\neg p(x)$

5 September 2006

Winsborough CS 3233 Lecture 4

4

In-Class Exercise

- Express $\neg(\forall x \exists y.(y < x))$ by a formula that has all the quantifiers out front

5 September 2006

Winsborough CS 3233 Lecture 4

5

More Translating

- $\forall p.\exists g.s(g,p)$
 - p ranges over problems
 - g ranges over groups
 - $s(g,p)$ means group g solved problem p
- Every group solved at least one problem
- Every group solved every problem
- At least one group solved a problem

5 September 2006

Winsborough CS 3233 Lecture 4

6

Logic and the Law

- Students in this class never break more than one law at a time
 - $b(p,t,l)$ person p breaks law l at time t
 - $c(x)$ means x is in the class

5 September 2006

Winsborough CS 3233 Lecture 4

7

Predicate Formulas as Specifications

- For the domain of integers, is $\forall x.(x>3)$ true or false?
 - How about $\exists x.(x>3)$?
 - Note: " $>$ " is the predicate symbol here
 - $X>3$ is another way of writing $>(x,3)$
- What does $\forall x \forall y.(x+y = y+x)$ mean?
 - Is it true?
 - What is the predicate here?
 - In logic, "+" is called a *function symbol* (term not introduced in the text)

5 September 2006

Winsborough CS 3233 Lecture 4

8

In Which Numeric Domains Does each of the Following Hold?

- $\forall x. \exists y. x < y$
- $\forall x. \exists y. y < x$
- $\exists x. \forall y. x \leq y$
- $\forall x. \forall z. (x < z \rightarrow \exists y. (x < y) \wedge (y < z))$

5 September 2006

Winsborough CS 3233 Lecture 4

9

Open and Closed Formulas

- Not in text
- A formula is *closed* if all variables are in the scope of some quantifier
- Otherwise, the formula is *open*
- $\Phi(x) \equiv \forall y. x \leq y$ is open
 - (In what numeric domains does $\Phi(0)$ hold?)

5 September 2006

Winsborough CS 3233 Lecture 4

10

Theorems and Proofs

- A *theorem* is a statement that can be shown to be true
- A proof is a demonstration that a statement is a theorem
- Methods of proof
 - Construction of truth tables
 - Use of equivalences
 - By using these alone, can prove only logical equivalences
 - More general rules of inference

5 September 2006

Winsborough CS 3233 Lecture 4

11

Important Related Terminology

- Result: often used to mean a theorem
- Proposition: a simple theorem, often presented without proof
- Lemma: a theorem whose main utility lies in helping to prove other, more interesting theorems
- Corollary: a theorem that follows easily from another more general theorem
- Conjecture: a statement that you suspect is true but that you do not yet have a proof for
